A site about growing
Hoyas in the
Northeastern United
States

Hoya cv. Mathilde

This is a cross between *H. carnosa* and *H. serpens* that is a very nice plant. I find that its difficulty level is also a mix between the two - It is not nearly as easy to grow as *carnosa*, but not nearly as hard as *serpens* can be. It was a plant that I had high expectations for, but it never quite lived up to them. I do however still keep the plant and would encourage you to try it as well. A well-grown Mathilde can be quite spectacular when all in bloom!
